6. Soldering of joints near the drain port must be done prior to connecting the Drain Line Flow Control fitting (DLFC). Leave at least 6” (15 cm) between the DLFC and solder joints when soldering pipes that are connected on the DLFC. Failure to do this could cause interior damage to the DLFC.

7. Plumber tape is the only sealant to be used on the drain fitting.

8. Make sure that the floor is clean beneath the salt storage tank and that the tank is level.

9. Place approximately 1” (25 mm) of water above the grid plate. If a grid is not utilized, fill to the top of the air check (Figure 1) in the salt tank. Do not add salt to the brine tank at this time.

**CAUTION**

If grid plate is used, cut air check height just below the grid plate. This is critical on 6”, 7”, 8” and 9” tanks. The brine refill water must come above the grid plate and make contact with the salt.

10. On units with a bypass, place in bypass position. Turn on the main water supply. Open a cold soft water tap nearby and let run a few minutes or until the plumbing is free from foreign material (usually solder) that may have resulted from the installation. Once clean, close the water tap.

11. Slowly place the bypass in service position and let water flow into the mineral tank. When water flow stops, slowly open a cold water tap nearby and let water run until the air is purged from the plumbing lines.

12. Plug the transformer into an electrical outlet.

**NOTE:** All electrical connections must be connected according to local codes. Be certain the outlet is uninterrupted.

---

**INSTALLATION**

**Water Pressure**

A minimum of 20 psi (1.4 bar) of water pressure is required for the regeneration valve to operate effectively.

**Electrical Facilities**

An uninterrupted power supply is required. The control uses a transformer to supply 12 VDC. Please make sure your voltage supply is compatible with your unit before installation.

**Existing Plumbing**

Condition of existing plumbing should be free from lime and iron buildup. Piping that is built up heavily with lime and/or iron should be replaced. If piping is clogged with iron, a separate iron filter unit should be installed ahead of the system.

**Location of System and Drain**

You must have an air gap on the drain line to prevent back flow of drain water into the system. A 2x the drain line pipe diameter air gap is required with a minimum 1” air gap.

**Installation Locations**

**FOR DRY LOCATIONS ONLY.**

**Bypass Valves**

Always provide for the installation of a bypass valve if unit is not equipped with one.

**CAUTION**

Water pressure is not to exceed 125 psi (8.6 bar), water temperature is not to exceed 110°F (43°C), and the unit cannot be subjected to freezing conditions.

**WARNING:** The system must be depressurized before removing any connections for servicing.

**Installation Instructions**

1. Place the media tank where you want to install the unit. Make sure the unit is level and on a firm base.

2. During cold weather, the installer should warm the valve to room temperature before operating.

3. All plumbing should be done in accordance with local plumbing codes. The pipe size for a residential drain line should be a minimum of 1/2” [13 mm]. Backwash flow rates in excess of 7 gpm [26.5 Lpm] or drain line length in excess of 20” [6 m] require 3/4” [19 mm] drain line. Commercial drain lines should be the same size as the drain line flow control.

**NOTE:** The tank should have the distributor tube installed and have the proper amount of regenerant in place.

4. Refer to the valve spec sheet for cutting height of the distributor tube.

5. Lubricate the distributor O-ring seal and tank O-ring seal. Place the main control valve on tank. Note: Only use silicone lubricant.

**Electrical Connection**

The controller operates on 12-volt DC power supply. Do not operate the controller with a power supply other than the one supplied by the manufacturer for this model.

**NOTE:** The power source should be constant. Be certain the power adapter is not on a switched outlet. Power interruptions longer than eight hours may cause the controller to lose the time setting. When power is restored, the time setting must then be re-entered.
TOUCHSCREEN CONTROL FEATURES

Features of the XTR2 Touchscreen Control

- Full-featured easy to use graphical touchscreen interface for programming, servicing, and diagnostics.
- Non-linear programming no longer requires cycling through every parameter when programming/servicing.

Buttons and Symbols

NOTE: Not all buttons appear on all screens.

Regeneration Cycle Wheel

- Displays the regeneration cycle step the system is currently in. The wheel rotates with each step so that the current step is shown in green.

NOTE: On metered units, the “Treatment” step on the Regeneration Cycle Wheel will flash when water is flowing through the unit.

Home

- Displays the Home screen.

Regeneration

- Displays the Regeneration screen, which allows you to start a regeneration and manually cycle through the regeneration steps.

Settings

- Displays the Settings screen, which allows you to adjust commonly used settings. Pressing this button while in the Settings screen provides access to the Master Settings screen, which allows you to fully program the valve.

NOTE: Due to the complexity of these settings and the potential for errors, Master Settings should only be accessed by your local water professional.

Diagnostics

- Displays the Diagnostic screen, which can assist in performing maintenance and troubleshooting performance issues with the valve.

Brightness

- Displays the Brightness screen, which allows for adjustment of the touchscreen display backlight.

Vacation Mode

- Halts all scheduled regenerations when pressed; press again to resume normal operation. When Vacation Mode is on, the 100 day regeneration error will be suspended.

Assistance

- Displays a name and phone number to call for unit service.

USB Connect

- Allows you to connect the control to a PC via a USB cable for field programming or download of diagnostic parameters via PC (Field Programmer application required).

Screen Navigation Arrows

- Displayed in the upper-left and upper-right corners of the screen, these arrows allow you to navigate from one screen to another. NOTE: Settings on previous screen are not saved unless 🔄 is pressed.

Settings Arrows

- These arrows allow you to change the values of certain settings when programming the control.

Alarm

- Displayed when an alarm has occurred; accompanied with an audible alarm. Press to silence the audible alarm.

Error

- Displayed when an error has occurred. Press to display the Error screen for more detailed error information.

Advance

- This arrow allows you to advance through cycle steps during a regeneration.

Reset

- Displayed in the Diagnostics screen to reset Totalizer and Peak Flow data and in Master Settings to reset parameters to factory or non-factory settings.

Accept

- Press to save or accept changes in control configuration.

Cancel

- Press to cancel configuration and exit to previous screen without saving.
TOUCHSCREEN CONTROL FEATURES

Screen Features

Home Screen

- **Regeneration**: Press to start a manual regeneration.
- **Settings**: Press to access commonly used settings.
- **Diagnostics**: Press to view diagnostic data.
- **Assistance**: Press to display the name and phone number to call for service.
- **Vacation Mode**: Press to halt all scheduled regenerations; press again to resume normal operation.
- **Regeneration Cycle Wheel**: Displays the cycle steps the valve will step through during a regeneration; the current cycle step is always at the top of the wheel.
  - **Treatment**: The unit is treating water
  - **Backwash**: Water flows from the bottom of the vessel to the top of the vessel to clean the media
  - **Draw**: Brine is drawn into the media and then slowly rinsed out
  - **Rinse**: Water flows from the top of the vessel to the bottom of the vessel to rinse the media
  - **Refill**: Brine tank is refilled with water
- **Next Scheduled Regeneration**: Displays the time to next scheduled regeneration, or volume remaining until regeneration in meter systems.

**NOTE**: If no button is pushed for five minutes, the screen will enter a power save mode. The unit will continue to operate, but the screen will be blank. Touch anywhere on the screen to exit power save mode.

- **Day and Time**: Displays the currently programmed day of the week and time. This button will flash if the control has been reset.

**Regeneration**

Regenerate the system on demand by pressing the Regeneration button on the home screen. Manual Regeneration can only be used while the valve is in the treatment position. From the Home screen, press the Regeneration button ». The Regeneration screen appears.

**Day and Time**

From the Home screen (displayed in Figure 10 above) press the Day and Time button. The Day and Time screen appears.

**Figure 10 - Home Screen**

The Home screen is always displayed unless the control settings are being configured or during regeneration. This screen displays general information about the system and allows you to start a manual regeneration or access control settings. Features of the screen are described below, followed by more detailed information about each feature.

**NOTE**: If no button is pushed for five minutes, the screen will enter a power save mode. The unit will continue to operate, but the screen will be blank. Touch anywhere on the screen to exit power save mode.

- **Regeneration**: Press to start a manual regeneration.
- **Settings**: Press to access commonly used settings.
- **Diagnostics**: Press to view diagnostic data.
- **Assistance**: Press to display the name and phone number to call for service.
- **Vacation Mode**: Press to halt all scheduled regenerations; press again to resume normal operation.
- **Regeneration Cycle Wheel**: Displays the cycle steps the valve will step through during a regeneration; the current cycle step is always at the top of the wheel.
  - **Treatment**: The unit is treating water
  - **Backwash**: Water flows from the bottom of the vessel to the top of the vessel to clean the media
  - **Draw**: Brine is drawn into the media and then slowly rinsed out
  - **Rinse**: Water flows from the top of the vessel to the bottom of the vessel to rinse the media
  - **Refill**: Brine tank is refilled with water
- **Next Scheduled Regeneration**: Displays the time to next scheduled regeneration, or volume remaining until regeneration in meter systems.
The Settings screen allows you to change basic control settings including time of regeneration and water hardness. These settings improve the operational efficiency of the system and can be adjusted independently from other control settings without needing to enter Master Settings.

From the Home screen, press the Settings button. The Settings screen is displayed.

- Press **day override** to adjust the number of days since last regeneration in which a new regeneration will automatically be run whether one is scheduled or not.
- Press **regen time** to adjust the time of day that an automatic regeneration cycle will begin.
- Press **hardness** to adjust the hardness setting. This value should match the hardness of the incoming untreated water supply.

**NOTE:** Changing the hardness setting recalculates treatment volume and regeneration interval. This setting should only be changed on the advice of a professional.

- Press to save your changes or press to return to the Home screen.

Additional features may be accessed from the Settings screen by pressing the buttons at the bottom of the screen (see Figure 13):

- **Master Settings:** Displays the Master Settings screen, which allows you to fully program the valve.
- **Brightness:** Displays the Brightness screen, which allows you to adjust the backlight brightness of the control screen.

**NOTE:** Due to the complexity of these settings and the potential for errors, Master Settings should only be accessed by your local water professional.

**NOTE:** Settings can not be accessed during a regeneration. If a regeneration starts while in the settings menu, the screen will return to the main screen and all parameters will be voided.

---

**User Assistance**

The Assistance screen displays the name and phone number that the homeowner may call for service of the unit. Press the Assistance button from the Master Settings or Home screens. The Assistance screen is displayed.

**for service or assistance:** please contact your local water professional

**NOTE:** The Assistance screen is also displayed automatically when the system reaches the programmed assistance interval. See TOUCHSCREEN CONTROL QUICK START.

---

**Master Settings**

The Master Settings screens include all configurable parameters available in the control.

**CAUTION** Improperly adjusting master settings may cause the system to operate incorrectly. Before entering master settings please contact your professional water dealer.

From the Settings screen, press the Settings button. A warning message appears.

---

**Master Settings**

before entering master programming please contact your local water professional

---

**Figure 15 Master Settings Warning Screen**

- Press to continue to the Password screen or press to return to the Home screen.
The Password screen displays a numeric keypad.

Enter the master settings password 1201 and press to continue to the main Master Settings screen, or press to return to the Home screen.

After entering the correct password and pressing , the main Master Settings screen is displayed.

Figure 16 Password Screen
- Enter the master settings password 1201 and press to continue to the main Master Settings screen, or press to return to the Home screen.

Figure 17 Main Master Settings Screen
While in the Master Settings screens, press to save all set parameters to a custom profile (see "NON-FACTORY SETTINGS" on page 15) or press the Home button to return to the Home screen.

Features of the Master Settings screens are described below. See MASTER SETTING PROGRAMMING and MASTER SETTINGS REFERENCE CHART for more detailed information.

- **format**: Contains settings for Language, Units, Assistance Name, Assistance Phone, and Assistance Interval. See TOUCHSCREEN CONTROL QUICK START for more information about these settings.
- **valve**: Contains settings for System, Valve, and Regeneration Type.
- **regen**: Contains settings for Regen Flow.
- **relay**: Contains settings for Aux 1 and Aux 2 relays.
- **meter**: Contains settings for Meter Types.
- **settings review**: Displays a summary of all programmed settings.

Press the screen navigation arrow at the top right of the screen to navigate to the secondary Master Settings screen.

Figure 18 Secondary Master Settings Screen
- remote regen: Contains settings for triggering a regeneration via a remote input.

**MASTER SETTINGS PROGRAMMING**

**CAUTION**: Improperly adjusting master settings may cause the system to operate incorrectly. Before entering master settings please contact your professional water dealer.

**NOTE**: If a regeneration is scheduled to occur while in Master Settings, the scheduled regeneration will be cancelled.

The following is a detailed overview of settings available in Master Settings. Please see the MASTER SETTINGS REFERENCE CHART for the complete set of values and ranges available to program while in Master Settings.

**Format Screen**
From the main Master Settings screen (Figure 17) press the format button to display the Format screen.
TOUCHSCREEN CONTROL QUICK START

The XTR2 control was designed to be easy to set up and begin using right out of the box. The following simple procedure can be used to set up the system and begin treating water in most typical applications.

NOTE: Steps 3 and 4 are optional and are not required to start the system. All control settings may be changed after the unit is in service.

NOTE: Press on any Quick Start screen to reset the screen back to its default settings.

1. After plugging in the unit, the Format screen (Figure 3) is displayed.

   **Format**

   - language
   - units
   - hardness units

   ![Figure 3 Format Screen](image)

   Press the **language** button to adjust the system’s displayed language (international version only): English, French, German, Italian, or Spanish. Press ✅ when finished.

   Press the **units** button to adjust the system’s units of measure (either U.S. or metric). Press ✅ when finished.

   Press the **hardness units** button to adjust the system’s hardness units of measure (grains per gallon, mg/L or ppm, German degrees, French degrees, or English degrees). Press ✅ when finished. Hardness units are adjustable only if metric units are selected.

   **NOTE:** If the screen is blank after plugging in the unit, touch the screen to turn the screen on.

2. After pressing ✅, the Assistance Name screen (Figure 4) is displayed.

   **Assistance Name**

   - abc
   - def
   - ghi
   - jkl
   - mno
   - pqr
   - stu
   - vwx
   - yz

   ![Figure 4 Assistance Name Screen](image)

   Using the keypad, type the name of the water treatment professional or company that the homeowner may call for system service (optional).

   To enter a letter using the keypad, quickly press the keypad button the number of times that correspond with the position of the correct letter on the button. For example, to enter the letter “C”, quickly press the ABC button three times. Press ✅ when finished.

3. After pressing ✅, the Assistance Phone screen (Figure 5) is displayed.

   **Assistance Phone**

   ![Figure 5 Assistance Phone Screen](image)

   Enter the phone number of the water treatment professional or company that the homeowner may call for system service (optional). Press ✅ when finished.

4. After pressing ✅, the Assistance Interval screen (Figure 6) is displayed.

   **Assistance Interval**

   ![Figure 6 Assistance Interval Screen](image)

   Use the Assistance Interval screen to set the interval in which the homeowner will need to call a water treatment professional for system service (optional). The assistance interval can be based on a set number of months (month based) or a number of regenerations (regen based).

   Press the **interval** button to select a month-based or regen-based assistance interval, then press ✅. Press either the **month** or **regen** button (depending on your previous selection), and select the number of months (up to 60) or regenerations (up to 2000) until the homeowner will need to call for service. Press ✅ when finished.
5. After pressing \( \text{Home} \), the Home screen (Figure 7) appears. The Day and Time button will be flashing, indicating that the day of the week and time need to be set. If the date and time are incorrect, press the Day and Time button to update to the correct day and time. The Day and Time screen (Figure 8) appears.

6. Start a regeneration by pressing the **Regeneration** button \( \text{Regeneration} \). The Regeneration screen appears (Figure 9).

![Figure 7 Home Screen](image)

**Figure 7 Home Screen**

The Day and Time button will be flashing, indicating that the day of the week and time need to be set. If the date and time are incorrect, press the Day and Time button to update to the correct day and time. The Day and Time screen (Figure 8) appears.

![Figure 8 Day and Time Screen](image)

**Figure 8 Day and Time Screen**

Press the Day of Week, Hour, Minute, and AM/PM/HR buttons to adjust the values to the correct day of week and time. Setting the value of the AM/PM/HR button to HR changes the display to a 24 hour clock. Press the Day, Month, and Year buttons to adjust the values to the correct date. Press the \( \checkmark \) button when finished to return to the Home screen. Press \( \times \) to return to the Home screen without saving.

7. For softener systems, put salt in the brine tank.

**NOTE:** Do not use granulated or rock salt.

The unit is now fully programmed and ready to treat water. This quick setup uses the control’s default settings, which are appropriate for most residential applications.
Typical Residential System Plumbing

Figure 30  Softened Water Flow
SYSTEM DISINFECTION

Disinfection of Water Softeners
The materials of construction of the modern water softener will not support bacterial growth, nor will these materials contaminate a water supply. During normal use, a softener may become fouled with organic matter, or in some cases with bacteria from the water supply. This may result in an off-taste or odor in the water.

Some softeners may need to be disinfected after installation and some softeners will require periodic disinfection during their normal life.

Depending upon the conditions of use, the style of softener, the type of ion exchanger, and the disinfectant available, a choice can be made among the following methods.

Sodium or Calcium Hypochlorite

Application
These materials are satisfactory for use with polystyrene resins, synthetic gel zeolite, greensand and bentonites.

5.25% Sodium Hypochlorite
These solutions are available under trade names such as Clorox*. If stronger solutions are used, such as those sold for commercial laundries, adjust the dosage accordingly.

1. Dosage
   A. Polystyrene resin; 1.2 fluid ounce (35.5 ml) per cubic foot.
   B. Non-resinous exchangers; 0.8 fluid ounce (23.7 ml) per cubic foot.

2. Salt tank softeners
   A. Backwash the softener and add the required amount of hypochlorite solution to the well of the salt tank. The salt tank should have water in it to permit the solution to be carried into the softener.
   B. Proceed with the normal recharge.

*Clorox is a trademark of the Clorox Company.

Calcium Hypochlorite
Calcium hypochlorite, 70% available chlorine, is available in several forms including tablets and granules. These solid materials may be used directly without dissolving before use.

1. Dosage
   A. Two grains (approximately 0.1 ounce [3 ml]) per cubic foot.

2. Salt tank softeners
   A. Backwash the softener and add the required amount of hypochlorite to the well of the salt tank. The salt tank should have water in it to permit the chlorine solution to be carried into the softener.
   B. Proceed with the normal recharge.

FLUSHING & CONDITIONING

The water softener should be installed with the inlet, outlet, and drain connections made in accordance with the manufacturer’s recommendations, and to meet applicable plumbing codes.

1. Program the valve control according to instructions shown in this manual.
2. Start an immediate regeneration by holding the Extra Cycle button for five seconds. Position the valve to backwash. Ensure the drain line flow remains steady for 10 minutes or until the water runs clear.
3. Position the valve to the brine draw/slow rinse position. Ensure the unit is drawing water from the brine tank (this step may need to be repeated).
4. Position the valve to the rapid rinse position. Check the drain line flow, and run for five minutes or until the water runs clear.
5. Position the valve to the start of the brine tank fill cycle. Ensure water goes into the brine tank at the desired rate. The brine valve drive cam will hold the valve in this position to fill the brine tank for the first regeneration.
6. Replace control cover.
7. Put salt in the brine tank.

NOTE: Do not use granulated or rock salt.
• **language**: Displays the language used on the control (international version only): English, French, German, Italian, or Spanish.

• **units**: Contains settings for the unit type (either US or Metric) to be used in the control.

• **hardness units**: Contains settings for hardness units of measure (grains per gallon, mg/L or ppm, German degrees, French degrees, or English degrees). Hardness units are adjustable only if metric units are selected.

**NOTE**: Degree hardness units are converted to ppm upon input. Degree inputs may be rounded up or down to the nearest ppm equivalent.

• Press the screen navigation arrows at the upper-right and left of the screen to navigate to the Assistance Name, Assistance Phone, and Assistance Interval screens. See TOUCHSCREEN CONTROL QUICK START for more information about these settings.

• Press \( \square \) to save changes.

### USB Connection for Field Programming

The XTR2 features a USB port that allows you to connect a PC to the control for field programming and diagnostic parameter download.

**NOTE**: Field Programmer software is required for field programming features. See XTR2 Field Programmer Manual for more information on using the Field Programmer software.

Pressing \( \square \) on the Format screen displays the USB screen.

![USB Screen](image)

**Connect the usb cable to the control and PC and start the field programming application**

When the USB screen appears, connect a USB cable to the USB port on the control circuit board. Connect the other end of the USB cable to a PC with the Field Programmer software installed and follow the directions in the XTR2 Field Programmer manual to complete the connection. Press \( \square \) to return to Master Settings.

**NOTE**: Do not remove USB cable from computer or control while connected and transferring data. See the XTR2 Field Programmer manual for proper disconnection procedure.

### Valve Screen

From the main Master Settings screen (Figure 17) press the **valve** button to display the Valve screen.

![Valve Screen](image)

**Regeneration Types**

The XTR2 control supports several different Regeneration Types. The Regeneration Type defines the method of automatic regeneration for the system. Each type is explained below.

**Time Clock**

Triggers a regeneration on a timed interval. The control will initiate a regeneration cycle at the selected Regeneration Time when the number of days since the last regeneration equals the Day Override value. The Day Override can be set from 1 - 99 days as well as partial day intervals of 4, 8, 12, 16 and 20 hours.

**Softener Immediate**

Measures water usage and regenerates the system as soon as the calculated system capacity is depleted. The control calculates the system capacity by dividing the unit capacity by the feed water hardness. Softener Immediate systems do not use a reserve volume. The control will also start a regeneration cycle at the programmed regeneration time if a number of days equal to the Day Override pass before water usage depletes the calculated system capacity. The Day Override parameter default is OFF, and REGEN TIME will be grayed out unless the day override value has been modified.

**CAUTION** When setting the system for softener immediate regeneration, setting the capacity to a value lower than that of feed water hardness may cause the system to constantly regenerate. If this occurs, disconnect the motor from the control and correct the capacity and feed water hardness values in Master Settings.

**Softener Delayed**

Measures water usage and regenerates the system at the selected Regeneration Time after the calculated system capacity is depleted. The control calculates the system capacity by dividing the unit capacity by the feed water hardness and subtracting the reserve.
MASTER SETTINGS PROGRAMMING

continued

The reserve should be set to ensure that the system delivers treated water between the time the system capacity is depleted and the actual regeneration time. Reserves can be set at a Fixed Volume, Fixed Percentage of capacity, a Variable Reserve based on the previous calendar day’s water usage, or a Weekly Reserve based on the average water usage for the current day of the week. The default for the day override parameter is OFF, and the default reserve type is Weekly Reserve.

A Softener Delayed control will also start a regeneration cycle at the selected Regeneration Time if a number of days equal to the Day Override pass before water usage depletes the calculated system capacity.

If the regen type is changed from Softener Immediate to Softener Delayed (or vice-versa), all parameters within those types will be reset to factory default.

Filter Immediate
Regenerates the system immediately after the selected Volume Override value is depleted. A Filter Immediate control will also start a regeneration cycle at the selected Regeneration Time if a number of days equal to the Day Override pass before water usage depletes the calculated system capacity.

Filter Delayed
Regenerates the system at the selected Regeneration Time after the selected Volume Override value is depleted. A Filter Delayed control will also start a regeneration cycle at the selected Regeneration Time if a number of days equal to the Day Override pass before water usage depletes the calculated system capacity.

NOTE: If Filter Immediate or Filter Delayed are selected, Regenerant Flow selections are limited to Filter and Upflow Filter.

Regeneration Screen
From the main Master Settings screen (Figure 17) press the regen button to display the Regeneration screen.

CAUTION Adjusting Regeneration settings will turn any set relays off. Any required relays will need to be reprogrammed in the Relay Output screen.

Relay Output Screen
From the main Master Settings screen (Figure 17) press the relay button to display the Relay Outputs screen.

- regen flow: Contains settings for the type of regenerant flow to be used in the valve. Changes to this setting affects the cycle steps displayed in the Regeneration Cycle Wheel on the Home screen. Regenerant flow cycle steps are described below. See TOUCHSCREEN CONTROL FEATURES for cycle step definitions.
  - downflow: Cycle steps are as follows: Backwash, Draw, Rinse, Refill
  - downflow 2X backwash: Cycle steps are as follows: Backwash, Draw, Backwash, Rinse, Refill
  - custom upflow / downflow / filter: Allows for up to 20 programmable cycle steps.
  - variable refill: Cycle steps are as follows: Refill, Pause, Draw, Backwash, Rinse. Variable refill calculates refill time based on salt dosage, media volume, and BLFC size.

- auxiliary 1 / auxiliary 2: Contains settings for programming up to two auxiliary relay outputs. There are three types of relays that can be programmed:
  - Cycle Based: The relay will turn on when the valve moves to the specified regeneration cycle steps. To program, select each cycle step button for which the relay should turn on.
  - Time Based: The relay will turn on and off at up to two specified start and end times.
  - Volume Based: The relay will turn on when the valve has treated a specified volume of water. Duration can be set for up to two hours.
  - Alarm Based: The relay will turn on when the specified alarm condition (or any alarm condition) is met. The relay will turn off when the alarm is cleared.
Meter Screen

From the main Master Settings screen (Figure 17) press the meter button to display the Meter screen.

- **meter type**: Contains settings for the type of meter installed with the system. The 5810/5812 valve uses an internal 1.25" turbine meter.
- **generic**: A generic option is available if the installed meter does not match any other selection. Requires setting the number of pulses per volume to ensure proper metering.
- **plumbing leak detect**: When active, triggers an alarm when continuous flow of .5 GPM or 1 LPM is detected by the flow meter over a 24 hour period.

Settings Review

From the main Master Settings screen (Figure 17) press the settings review button to display the Settings Review screens, which display a read-only summary of all programmed settings in the control.

Remote Regen Screen

From the secondary Master Settings screen (Figure 18) press the remote regen button to display the Remote Regen screen.

- **remote regen duration**: Contains settings for triggering a regeneration via a remote input. Select a value in seconds that the remote switch must be closed in order to trigger the regeneration.

Connect a remote switch (such as a differential pressure switch) to the remote start input terminals on the back of the XTR2 control board. When the remote switch remains closed for the number of seconds specified in the Remote Regen screen, a regeneration will be triggered regardless of volume, capacity, or time remaining until the next scheduled regeneration.
Non-Factory Settings

After all parameters in Master Programming have been set, these settings can be saved to a custom profile by pressing on the main Master Settings screen (see Figure 17 Master Settings Screen). After pressing , the Non-Factory Settings screen appears.

Press to save all programmed Master Settings parameters to non-factory settings. At any point, the control can be reset to these saved custom settings. By performing a custom reset, any setting that is subsequently programmed without saving to non-factory settings will be reset to the previously saved non-factory settings in the control.

Diagnostics

The control records and displays a variety of diagnostic data to assist with troubleshooting performance issues and fine-tuning system efficiency. Press the Diagnostics button from the Master Settings or Home screens to view the Diagnostic screen.

- Press the screen navigation arrows at the upper-right and left of the screen to view each diagnostic parameter.
- Press the Error Log button to access the Error Log screen. To clear the Error Log, press the Reset button then the Reset button again on the Clear All Error Logs screen, then enter “1201” at the password prompt screen, then press the Accept button to confirm.

Press to save all programmed Master Settings parameters to non-factory settings. At any point, the control can be reset to these saved custom settings. By performing a custom reset, any setting that is subsequently programmed without saving to non-factory settings will be reset to the previously saved non-factory settings in the control.

Diagnostics

Press the Diagnostics button from the Master Settings or Home screens to view the Diagnostic screen.

- Press the screen navigation arrows at the upper-right and left of the screen to view each diagnostic parameter.
- Press the Error Log button to access the Error Log screen. To clear the Error Log, press the Reset button then the Reset button again on the Clear All Error Logs screen, then enter “1201” at the password prompt screen, then press the Accept button to confirm.

Press to save all programmed Master Settings parameters to non-factory settings. At any point, the control can be reset to these saved custom settings. By performing a custom reset, any setting that is subsequently programmed without saving to non-factory settings will be reset to the previously saved non-factory settings in the control.

Diagnostics

The control records and displays a variety of diagnostic data to assist with troubleshooting performance issues and fine-tuning system efficiency. Press the Diagnostics button from the Master Settings or Home screens to view the Diagnostic screen.

- Press the screen navigation arrows at the upper-right and left of the screen to view each diagnostic parameter.
- Press the Error Log button to access the Error Log screen. To clear the Error Log, press the Reset button then the Reset button again on the Clear All Error Logs screen, then enter “1201” at the password prompt screen, then press the Accept button to confirm.

Press to save all programmed Master Settings parameters to non-factory settings. At any point, the control can be reset to these saved custom settings. By performing a custom reset, any setting that is subsequently programmed without saving to non-factory settings will be reset to the previously saved non-factory settings in the control.

Diagnostics

The control records and displays a variety of diagnostic data to assist with troubleshooting performance issues and fine-tuning system efficiency. Press the Diagnostics button from the Master Settings or Home screens to view the Diagnostic screen.

- Press the screen navigation arrows at the upper-right and left of the screen to view each diagnostic parameter.
- Press the Error Log button to access the Error Log screen. To clear the Error Log, press the Reset button then the Reset button again on the Clear All Error Logs screen, then enter “1201” at the password prompt screen, then press the Accept button to confirm.

Press to save all programmed Master Settings parameters to non-factory settings. At any point, the control can be reset to these saved custom settings. By performing a custom reset, any setting that is subsequently programmed without saving to non-factory settings will be reset to the previously saved non-factory settings in the control.

Diagnostics

The control records and displays a variety of diagnostic data to assist with troubleshooting performance issues and fine-tuning system efficiency. Press the Diagnostics button from the Master Settings or Home screens to view the Diagnostic screen.

- Press the screen navigation arrows at the upper-right and left of the screen to view each diagnostic parameter.
- Press the Error Log button to access the Error Log screen. To clear the Error Log, press the Reset button then the Reset button again on the Clear All Error Logs screen, then enter “1201” at the password prompt screen, then press the Accept button to confirm.

Press to save all programmed Master Settings parameters to non-factory settings. At any point, the control can be reset to these saved custom settings. By performing a custom reset, any setting that is subsequently programmed without saving to non-factory settings will be reset to the previously saved non-factory settings in the control.
# Before entering Master Settings, please contact your local professional water dealer.

**NOTE:** Some items may not be shown depending on control configuration. The control will discard any changes and exit Master Settings if any button is not pressed for five minutes.
MASTER RESET
Press the button while in the Master Settings main screen (Figure 17) to display the Reset screen.

Figure 31 Reset Screen
Press the factory button to reset all control parameters to their factory defaults, or press the non-factory button to reset control parameters to previously saved custom settings [see “NON-FACTORY SETTINGS” on page 15]. A warning screen appears before parameters are reset. Press to confirm the reset or press to return to Master Settings.

CONTROL OPERATION

Control Operation During Regeneration
During regeneration, the Regeneration Cycle Wheel shows the regeneration step the valve is advancing to, or has reached, and the time remaining in that step. Once all regeneration steps are complete the valve returns to treatment position and resumes normal operation. The time remaining in regeneration will be displayed on the home screen in hours and minutes. Pressing the button during a regeneration cycle immediately advances the valve to the next cycle step position and resumes normal step timing. The button is only shown when the valve is in position and the motor has stopped.

Control Operation During Programming
The control can only be programmed with the valve in treatment. While being programmed the control continues to operate normally, monitoring water usage and keeping all displays up to date. Control programming is stored in memory permanently until reset.

Control Operation During a Power Failure
The XTR2 includes internal power backup. In the event of power failure, the control shifts into a power-saving mode. The control stops monitoring water usage. The display and motor shut down, but it continues to keep track of the time and day for a minimum of eight hours.

The system configuration settings are stored in a non-volatile memory and are stored indefinitely with or without power. After a long power outage, the Time of Day button may flash indicating it needs to be reset. Press the button to stop the Time of Day from flashing and reset time if needed.

If power fails while the unit is in regeneration, the control will save the current valve position before it shuts down. When power is restored, the control will resume the regeneration cycle from the point where power failed. If power remains off for more than eight hours, upon power restoration the regeneration is canceled and the piston returns to service.

CAUTION If power fails during a regeneration cycle, the valve will remain in its current position until power is restored. The valve system should include all required safety components to prevent overflows resulting from a power failure during regeneration.

The control will not start a new regeneration cycle without power. If the valve misses a scheduled regeneration due to a power failure, it will queue a regeneration. Once power is restored, the control will initiate a regeneration cycle the next time that the Time of Day equals the programmed regeneration time. Typically, this means that the valve will regenerate one day after it was originally scheduled. If the treated water output is important and power interruptions are expected, the system should be set up with a sufficient reserve capacity to compensate for regeneration delays.

Remote Lockout
If a remote switch is installed, the control will not allow the system to go into regeneration until the regeneration lockout input signal to the control is cleared. This requires opening the contact closure to clear the lockout condition. The recommended gauge wire is 20 with a maximum length of 500 feet. See “WIRING DIAGRAM” on page 31.

Sleep Mode
The control will go into sleep mode if no button is pressed after five minutes. All other control fuctions will continue to operate. The display will wake from sleep mode when any part of the display is touched.

ALARMS AND ERRORS
If an error in valve or control function occurs, an alarm will sound and the Home screen will display the Error Alert button and the Alarm button.

If the display is in sleep mode when an error occurs, the screen will turn on for five minutes. The error will beep for one second per minute until the error is cleared. If the error is not cleared after five minutes, the screen will switch to sleep mode and display the Error Alert button as a screen saver.

See TROUBLESHOOTING for more information about error conditions.
## Troubleshooting

<table>
<thead>
<tr>
<th>Problem</th>
<th>Cause</th>
<th>Correction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Valve constantly regenerates</td>
<td>Error in programming has caused a regeneration loop condition in the control.</td>
<td>Disconnect the motor from the control circuit board [see “WIRING DIAGRAM” on page 31 for location on circuit board]. A Motor Stall error will occur, allowing access to Master Settings. Navigate to the Valve screen and check Regen Type settings. Ensure that the value for Capacity is larger than the value for Hardness, and save settings. If the error continues to occur, unplug the unit, put it into bypass and contact technical support.</td>
</tr>
</tbody>
</table>

### Error Alerts

**NOTE:** An Error Alert appears on the Home screen if an error condition is detected. Press the Error Alert button to view the error message.  
**NOTE:** Most error alerts are cleared at regeneration. If the error persists following a regeneration attempt the appropriate reset and recovery procedure below or contact technical support.

<table>
<thead>
<tr>
<th>Error Screen Display</th>
<th>Cause</th>
<th>Reset and Recovery</th>
</tr>
</thead>
<tbody>
<tr>
<td>Motor Stall</td>
<td>No state changes in the optical sensor are detected for six seconds.</td>
<td>Unplug the unit and plug back in. Allow the control to attempt to find position again. Verify the optical sensor is in place with the wires connected to the circuit board. Verify the motor and drive train components are in good condition and assembled properly. Check the valve and verify that the piston travels freely. Replace/reassemble the various components as necessary. Plug the unit back in and observe its behavior. If the error reoccurs, unplug the unit, put it into bypass and contact technical support.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Error will clear when flow to meter drops below 0.5 GPM or 1 LPM. If continuous flow is expected, turn plumbing leak detection off in Master Settings.</td>
</tr>
<tr>

**See NOTE below.

**NOTE:** Install injector in hole "DF" and plug in hole "UF" for downflow units. In upflow units the plug and injector are installed in reverse holes. In filter units, both injector holes are plugged with 61959. See illustration below.

**NOTE:** Install plug in hole "A" for units that allow hard water to flow during regeneration. For no hard water bypass (downflow only), install plug in hole "B". See illustration below.

---

* Includes items 24 and 25. Each valve body is installed with adapters for a 4" tank base and packaged with distributor adapter kits for 1.5" distributors (items 24 and 25).

NOTE: The reset switch discharges the super capacitor when power is removed from the control. The super capacitor retains the current time of day in the event of a power failure. Pressing the reset switch on the circuit board while power is applied to the control will have no effect on the control or stored settings.
